

Automotive (Branding, Promotion & Social Media Virality)

Background

A company competing in USD 200 Million after-sales auto horn market wants to launch a new product line and interested in an online market research survey.

Problem

The company is well known for its horns across India and is interested in launching a new product line of horns. Before investing in the product line, the company wants to assess the market demand, the potential and appropriate pricing strategy to enter the market.

Solutions

vidCampaign team analyzed the best possible solution and came up with the video survey strategy. The team came up with the video of the product specification and the demo of the same. Now the campaign survey questionnaire was developed based on the feedback from the company and the experience of the vidCampaign team. The survey was conducted in various parts of the country and with individuals mixed up in B2B and B2C segments.

Result

The video survey reached out to approx 1 Million people in total. The survey results were filtered to identify the list of people who watched the video before they took the survey, and the individual survey was analyzed and the entire report was submitted to the management team that had insights based on the region, location, interests, who are interested in buying in e-commerce, etc., which helped them take statistical business decisions. Now the company is planning to launch a e-commerce model to sell the horns (www.horns.in)

Benefits

Location specific walk-through helped the end consumer to relate it to what they will get from this place and how they wanted the facility to be build. This helped the customer have a clear understanding on the choice and taste of the locality and invest in a more calculative business.
